Brinkerhoff Environmental Services, Inc. consistently provides high quality environmental consulting services. Projects are completed within budget and on schedule.

Our professionals have experience conducting soil and groundwater remediation as per the NJDEP Technical Requirements for Site Remediation (N.J.A.C. 7:26E). We have successfully completed remediation at many contaminated sites, including former manufactured gas plants, fuel storage and pipeline facilities, industrial facilities and manufacturing facilities. Our clients include Fortune 500 companies, larger engineering companies, attorneys, municipalities, public utilities, and regulatory agencies.

The application of new technology for soil and groundwater remediation involves assessment of biologic and chemical components within a contaminant plume. Dissolved oxygen, ph, and aerobic vs. anaerobic conditions may play an important role in determining which technology may work best.

Among the services Brinkerhoff offers:

- Application of new technologies to enhance soil and groundwater remediation projects, such as *in situ* chemical oxidation and biologic enhancement

- System modifications for increased energy efficiency

- Installation of remote monitoring systems
- Rehabilitation of low-productivity wells, collection systems and other system modifications to expedite remedial progress
- Evaluation of treatment goals and developing strategies for negotiating with the regulatory agencies

**Please call us to discuss how Brinkerhoff's staff can assist with your ongoing or future remedial requirements.**
